

Essential Reminder: Updated Information of DFS certification issue by FCC

As for holding up the approval of any DFS (Dynamic Frequency Selection) master Certification, Federal Communication Committee (FCC) published the interim plans on 5th October 2009.

FCC announced few months ago that NTIA is currently investigating interference with UNII Master Devices, so the FCC has currently halted issuing new Certifications of Master devices until further notice.

Recently, FCC published the interim plans. In the interim, the Commission will allow certification of wireless master devices with radar detection function and with DFS capability, if they meet the following conditions:

- Devices are intended for indoor operations only;
- Devices will not permit operations on channels which overlap the 5600 - 5650 MHz band;
- Devices meet all the other requirements specified in Section 15.407 and no configuration controls are provided to change the frequency of operations outside the grant of certification for US operation.

More details about the interim plan published by FCC, please see: [KDB# 443999](#)
